There are no hazardous ingredients as defined by the U.S. Department of Labor 29CFR, 1915, and 1917. GRAFOIL® flexible graphite is essentially pure graphite and has the typical properties of graphite, i.e., chemical inertness, does not contain binders, lubricants, or fillers. The FDA has expressed the opinion that GRAFOIL® flexible graphite used as gasketing in food processing equipment is not considered to be a food additive. Based on this reply, the use of GRAFOIL® gaskets can be used in food and cosmetic processing equipment with the assurance that the FDA does not consider it to be a food additive and is therefore of no concern to them.
